

Drone Research for Disturbance and Habitat Monitoring

UF/IFAS RANGE CATTLE RESEARCH AND EDUCATION CENTER,
ONA, FL
RANGELAND WILDLIFE AND ECOSYSTEMS PROGRAM

Drone Technology: History

- Nikola Tesla "Father of Unmanned Vehicle Technology" – 1898 radio controlled boat
- 1800's to present day – Various military applications
- 2013 drone technology advanced rapidly

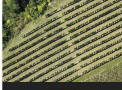

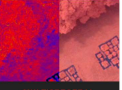

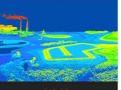

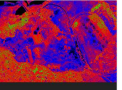

Drone Technology: Multiple Platforms

- Large areas covered fast.
- Longer flight times.
- Some issues with image blur from speed.
- Only directly down (NiDar) imagery.
- Better for accuracy and resolution.
- Shorter flight times.
- Stable and high resolution images.
- Gimbal allows multiple angle imagery.

Drone Technology: Multiple Sensors for Multiple Applications

 <p>VISUAL Capture high-resolution, low-resolution aerial imagery.</p>	 <p>THERMAL Track the real-time surface temperature of soil and plants.</p>	 <p>MULTISPECTRAL Capture near-infrared radiation and other visible wavelengths for biomass analysis.</p>	 <p>LIDAR Collect high quality, accurate elevation data of terrain and man-made objects.</p>	 <p>HYPERSPPECTRAL Capture spectral information to identify minerals, vegetation and other materials.</p>
Surveying, plant counting, volume measurements, surveillance, 2D and 3D mapping	Measure surface temperature: heat stress, water use, canopy /plant metabolism.	Measure plant health: nutrient deficiencies, productivity, pest damage.	Measure distances and elevation. Create topographical maps.	Measure plant nutrient status, identify minerals, surface chemical composition.

Our Drone Research: Platform

- DJI Phantom 4
 - Easy to fly - Manual or automated flights
 - 3-axis gimbal and 12 MP camera
 - Up to 20 minute battery life
 - Easy to use Apps for manual and mission planning
 - Built in FPV (first person view)
 - \$1,200 (Drone, remote controller, one battery and cables)

Our Drone Research: Flight Apps

- DJI Go App – Manual Flights
 - Compatible with iPhone/iPad
 - Multiple flight modes (Follow me, course Lock, To Waypoint, Point of Interest)
 - Live video feed

Our Drone Research: Flight Apps

- Map Pilot for DJI App – Autonomous Flights
 - Draw a polygon
 - Set altitude, overlap, speed
 - Save, upload and start mission
 - Live feed of mission progress
 - Returns to home when mission complete
 - Multi-battery flights for large areas

Our Drone Research: Data Pipeline

- Create mosaics from raw imagery
 - Maps Made Easy – online aerial map processing site
 - Upload raw images, image GPS EXIF tags used to georeferenced
 - Download mosaic, 2.5 cm ground resolution
 - <100 images = free, 0.015¢/image, 0.38¢/acre
- Other options
 - DroneDeploy.com
 - Pix4DMapper Software
 - ArcGIS Drone2Map Software

Our Drone Research: Feral Swine Rooting Damage

- Assess temporal periods of rooting damage over season and across 3 years
- Buck Island Ranch, Highlands County
 - 36 small seasonal wetlands
 - 25 forty acre pastures

Our Drone Research: Feral Swine Rooting Damage

- 1) Collect aerial images with drone and create mosaics
- 2) Georeference images with ground control points

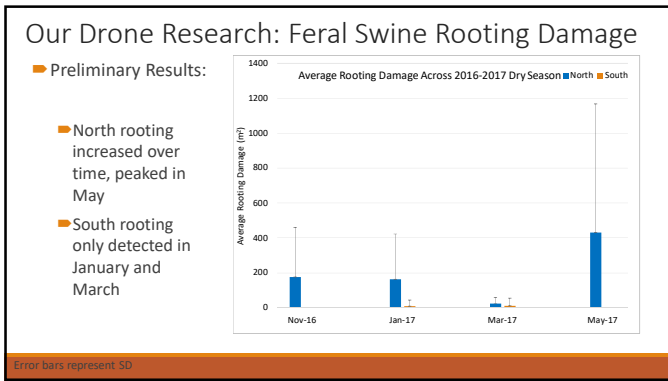

Our Drone Research: Feral Swine Rooting Damage

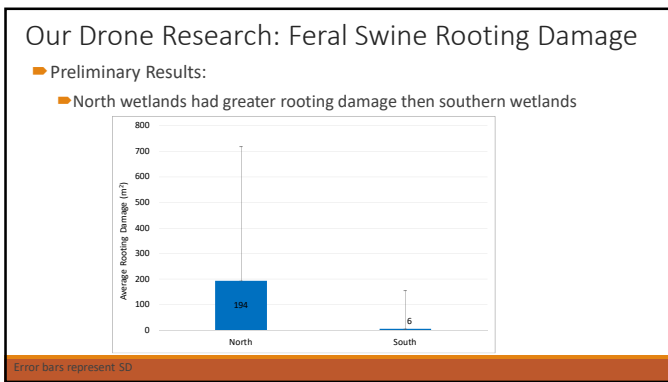

- 3) Use ArcGIS software to classify each pixel as rooting or non-rooting
- 4) Convert to polygons and calculate the total area of rooting

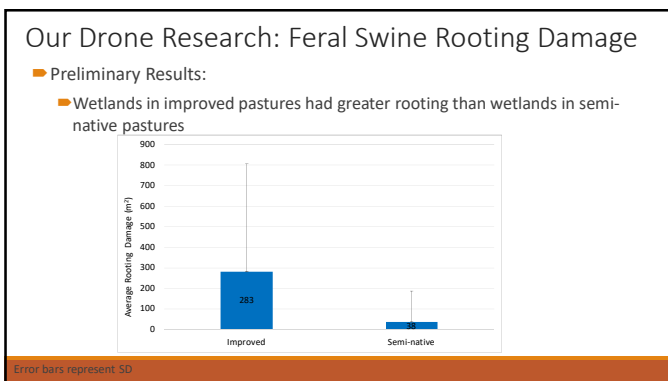

Our Drone Research: Feral Swine Rooting Damage

- Preliminary Analyses:
 - Difference in rooting damage between north and south wetlands post swine removal?
 - Difference in rooting damage in wetlands in improved and semi-native pastures?
- Fall 2016 – Removed 95 pigs from the south
- Analyzed rooting from four rounds of flights across 2016-2017 dry season
 - 11 wetlands in south (all semi-native)
 - 10 wetlands in north (5 in improved and 5 in semi-native pastures)

Our Drone Research: Feral Swine Rooting Damage

Future analyses:

- Examine seasonal and annual variation in rooting damage
 - Incorporate pig population density
 - Compare against pasture imagery
- Examine impacts on wetland fauna
 - Community assemblages
 - Salamander occupancy of wetlands
 - Growth and stress levels of tadpoles

Our Drone Research: Future Research

Pre and post prescribed burns

- Examine changes in canopy cover and gap development needed for native vegetation and forage grasses to grow
- Prescribed burn regime should decrease canopy cover and increase gaps needed for native vegetation and forage grasses to grow
- Impacts to native cattle grazing and wildlife (e.g. Bobwhite quail)

Our Drone Research: Biggest Challenges

- Learning the technology – However huge advancements recently in drone user-friendliness

Our first drone (3DR X8) and successful mosaic

- Data storage – Processing and storing images takes a lot of space
 - Almost 4TB from 3 years of data collection

Archbold Fire Severity Mapping
Vivienne Sclater and Kevin Main

Diagram showing the transition from a traditional propeller plane to a drone for fire severity mapping.

Background and Intro

The Old Way.....

Oblique images from fixed-wing aircraft

Waiting to fly until several burns are completed (due to flight cost) results in lower quality images (resprouting)

Diagram illustrating the traditional method of using fixed-wing aircraft for fire severity mapping, which involves waiting for multiple burns to complete before flying, leading to lower quality images due to resprouting.

And now.....

Images straight down from a drone

Fly each burn individually – within days of fire

Mosaicked, rectified images used directly in ArcGIS

Higher mapping accuracy

Saves time
