November 1, 2022

1

USDA, Long-Term Agroecosystem Research Network (LTAR)

Research network focused on finding solutions that **maintain or increase** agricultural productivity, environmental quality, and people well-being

Main Priorities:
 1. Increasing agricultural production
 2. Protecting the environment
 3. Advancing rural prosperity

<https://ltar.ars.usda.gov/>

2

Coordinated, large-scale, cross-disciplinary research

- 21 Working groups focused on specific research questions
- Working groups carry out coordinated, large-scale data collection and provide the infrastructure required to analyze and to disseminate research data

Archbold Biological Station & University of Florida LTAR Site

How does innovative management affect cow-calf production and multiple ecosystem services across a land use intensity gradient?

1. Cultivated pastures – 16 x 20 acres (UF RCREC)
2. Cultivated pastures – 8 x 40 acres (Archbold BIR)
3. Semi-native pastures – 8 x 40 acres (Archbold BIR)
4. Native rangeland – 16 x 40-70 acres (UF RCREC)

5

Common Experiment ABS-UF Sites

Archbold Biological Station

UF/Range Cattle REC

Unburned

Burned (2 or 4 yr)

Burned + chopped (4 yr)

6

UF Common Experiment

- 16 experimental units (~40-70 acres each)
- 5 transects (150 ft) in each experimental unit
- Winter grazing (90 d; Nov. to Jan; ~13 acres/animal)

March 26, 2021

7

USDA UF Common Experiment – Native Rangelands

Fire 4 yr - Business as usual (BAU)

Fire 2 yr - Aspirational

Fire 4 yr + chopping

Unburned

8

Vegetation manipulation with prescribed fire

Saw-palmetto (*Serenoa repens*) – C₃

Chalky bluestem, Indiangrass – C₄

9

Measurements in the Common Experiment

- Fire characteristics:** peak temperature, heating duration, % combusted biomass, ash deposition
- Vegetation:** composition, herbage mass, nutritive value, tissue mineral composition
- Soils:** soil chemical, physical and biological properties, nutrient cycling, soil carbon (quantity and quality, spatial distribution of nutrients/soil properties)
- Environmental:** greenhouse gas measurements (2 eddy covariance towers (CO₂,CH₄) and chamber-based)
- Animals:** body condition score, body weight, blood metabolites (cortisol, plasma urea N, glucose, IGF1), animal behavior, calf birth and weaning wt.

Fire impacts on ecosystem C fluxes

Drone image

Eddy covariance is a micrometeorological method that continuously measure the concentration of carbon and non-carbon gases in the atmosphere

Net Ecosystem Exchange (NEE) - the difference between the total amount of carbon fixed by plants in the process of photosynthesis (gross primary production) and carbon released by heterotrophic (soil/litter) and autotrophic respiration (plants and roots)

Results

Carbon dynamics and soil greenhouse fluxes in a Florida's native rangeland before and after fire

Russell Bruland¹, Maria Lucia Ribeiro², David Douglas³, Sam M.D. Sanchez⁴, Mota M. Khatami⁵, Gordon B. Woodard⁶, Gerardo Gallo⁷

ABSTRACT

Using field and lab CO₂ and CH₄ sensors, we measured ecosystem CO₂ and CH₄ fluxes, soil CO₂ and CH₄ concentrations, and soil C and N dynamics in a Florida native rangeland before and after a fire. We found that the fire had a short-lived effect on ecosystem CO₂ and CH₄ fluxes, and that the rangeland acted as a C sink during the 4-yr study. The fire had a short-lived effect on soil C and N dynamics, and that the rangeland acted as a C sink during the 4-yr study.

Year	SEP	QTY	Rain	ET	ET (mm)	Energy (MJ/m ²)	ET-Energy
2016	-809	1894	1445	NA	1062	3089	-0.97
2017	327	1750	1422	NA	1023	1124	6.08
2018	-569	1861	1452	11	1070	1800	0.81
2019	182	2003	1851	78	1147	1929	1.81

- Fire effect was short-lived: 60 d after fire vegetation photosynthetic capacity
- Native rangeland acted as a C sink sequestering ~ -1148 g C m⁻² during the 4-yr study (2.9 Mt C ha⁻¹ yr⁻¹)
- Florida's rangeland a very resilient ecosystem and a viable option for C mitigation under forecasted climate scenarios and management
